Table of contents

- 1 Warnings/ Safety Information
- 2 General product specification, characteristics, optional modes of operation
- 3 Settings, operational elements, functional displays
- 4 Settings menu, graphics and information about adjusting the parameters
- 5 Fault message on the display, possible malfunctions, corrections
- 6 Installation, pneumatic and electric connection, and connection of 3~ and 1~ motors
- 7 Trial phase without pumps
- 8 Technical specifications
- 9 Applied harmonised standards
- 10 Attached: Plans of terminal connections

Last Update: 26.01.2010

1.0. Warnings and Safety information for installing and initiating the control unit

1.1. Areas of Application

The control unit is designed for the use in the areas of sewage-, wastewater-, and rainwater disposal.

For activating pumps that run in an Ex-area, the following needs to be considered: The control unit itself has to be mounted outside of the Ex-area.

When using external 4-20 mA level sensors and floating switches that are mounted in the Ex-area, you have to utilize components with according approvals.

When connecting three phase current motors the following limiting values **always** have to be adhered to when setting the electric motor current limit, as well as for settings of mechanic motor protection switches.

Standard Model

optional (only if specifically ordered)

	4 KW Contactor		5,5 KW Contactor
Three phase current 400 V	Max. 9 A	Three phase current 400 V	Max. 12 A
Alternating current 230 V	Max. 11,5 A	Alternating current 230 V	Max. 14,5 A

1.2. Qualification of personnel

The personnel for installing, initiating, and maintaining the control unit has to hold according qualifications for this work.

1.3. Safety information for the operator

The existing safety rules and risk management plans and local energy supply companies should be followed. When opening the unit (Taking the safety screen or a cover off) or when working at the pump the power to the control unit needs to be shut off through an external pre-fuse or a separate main switch.

1.4. Hazards if safety information is neglected

Neglecting safety information will endanger people and product/ unit. When Neglecting safety information you are subject to lose any entitlement to damages.

1.5. Operating manual

For the installation, initiation, and maintenance of the control unit the operating manual has to be followed. Adhering to the limiting values found in the manual is absolutely necessary.

A circuit protection to the mains of max. 3 x 16 A needs to be installed.

1.6. Arbitrary modification and supply with replacement parts

Modifications of the product are only authorized if cleared with the manufacturer in advance. Original parts and accessories authorized by the manufacturer serve safety purposes. Using different parts may waive manufacturer's liability for possible consequences.

1.7. Prohibited operations

The safety of operation of the delivered product can only be granted when the product is used appropriately according to paragraph 1.1 of the operating manual. The limiting values given in technical values have to be adhered to in any case.

1.8. Transport and storage

The control unit needs to be stored and transported avoiding damage by blows, crush, and temperatures outside the range of -20° C to $+60^{\circ}$ C.

2.0. General product specifications, characteristics, and optional modes of operation

2.1. Product specifications

The pump control unit PS1 - LCD N is utilized for automatic level control/regulation of liquid levels. The liquid level is alternatively determined by impact pressure, supply of air, an external sensor (4-20 mA), or floating switch. The motor contactor directly triggers a pump up to max. 4 KW (optional to 5.5 KW) rated power. Additionally, there are 2 relay contacts available to display fault reports. Operation and adjustment are fairly easy. Switching points, times, and motor current limit will be adjusted by a digital potentiometer. All values can be checked on the LC – display. LED's signal operational status and fault messages. Push buttons for the functions Hand – 0 – Auto are still available.

2.2. Characteristics

- LCD plain text display

- Hand - 0 - Auto functions

- Acknowledgment button

Forced activation of pump
Internal acoustic alarm

- Thermal and electrical control of the pump
- Deactivation of pump through stop level and stop delay.
- Electrical control of motor current
- Variable start-delay
- Collective fault signal voltage free and non-isolated 230V~
- Memory amount of pump activations
- Amperemeter
- Simple operation

- High stability - Atex - Mode

High-water alarmOperating hour meter

- Service Mode
- Determination of level is achieved alternatively through internal pressure converter, external 4-20 mA Level sensor or floating switch.
- Select effective range of the external 4 20 mA level sensor over the menu in the range between 0 12.50 m
- Connection to remote-control system through digital and analog plug-ins and outlets
- All settings and fault reports will stay available after a power outage
- All functions of previous versions and terminal connections remain the same
- Reserve inputs for remote action module, timer, or others (will only be included into the program if needed)

NEW ! NEW included in delivery!

- Control for rotating field- und phase cancellation (to be activated in the menu)
- Control of operating time
- Input for floating switch dry run protection
- Analog outputs 0-10 V and 4-20 mA
- Fault memory
- When running in manual mode the pump shuts down automatically after 2 minutes

2.3. Optional functions and components

(Only included in delivery if explicitly stated in your order)

- External interlock (In this case, the dry run protection is omitted)
- The display indicates maintenance
- Integrated main switch
- Integrated mechanical switch for motor protection
- Additional pressure sensor for redundant high water alarm with activation of the pump.

3.0. Adjustment, operational elements and functional displays

3.1. With the digital potentiometer "*Anzeige*", all values and settings can be checked. If a setting needs to be adjusted, the potentiometer has to be turned until the display shows the desired setting. Now the button "*Auswahl/Quittung*" needs to be pressed. The value saved last will start to flash. Settings may be changed by the potentiometer. Turning fast will cause greater changes of the values, turning slowly allows for precise adjustments. Once the desired value is attained, it needs to be confirmed with the button "*Auswahl/Quittung*". The value stops flashing and is saved. All values need to be checked once before the initial start-up. After 20 seconds, the display automatically switches back to the initial setting.

The hours of operation are accounted for continuously. Changing or resetting them is not possible.

3.2. Operational elements

-Digital By activating the digital potentiometer, all settings as well as fault messages, hours of operation, number of pump activations, and motor current can be checked. Additionally the settings are adjusted with the digital potentiometer. If the turning knob has not been activated for more than 20 seconds the display will return to the initial setting. (Compare to 3.1 Settings)

-Button By pressing the button the malfunctions Overload, Pump Off, and Thermal Fault 2 will be confirmed after the cause has been eliminated. In case a malfunction still remains active, only the collective-fault -message-relay and the piezo-buzzer will be turned off. This is also the case for Thermal Fault 1 and High-water alarm. Additionally, settings can be changed via this button (compare to 3.0 Settings).

Niveau Control PS1-LCD N	- HAND	By pressing this button the pump is activated in manual mode. The green LED flashes
	NEW !	If the pump is activated in manual mode, the pump will automatically shut off after 2 minutes and the green LED will flash irregularly.
Hand - 0 - Auto	- 0	The pump is deactivated The green LED is off.
Anzeige Auswahl Quittung	- AUTO	The pump will be activated by the level The green LED shows a continuous green light.

Attention: After having interrupted the current in manual mode, the control unit will switch to automatic mode. The modes of operation "AUTO" and "0" remain saved even in case of 0 potential (a current interruption).

3.3. Display of Function by LEDs

LED – red	= high-water alarm, malfunction
LED – yellow continous light	= the pump is operating
LED – yellow flashing	= the pump is operating in stop delay mode
LED –green continous light	= operates in Automatic mode
LED –green flashing	= operates in manual mode
LED – green irregular flashing off after 2 minutes	= manual mode has shut

3.4. Display

In the first line, the level will be displayed at all times. In the lower lines hours of operation are displayed as long as the pump has not been activated. If the pump is operating, the motor current will be displayed. In case any malfunctions have occurred, they will appear alternately in the lower line of the display.

4.0. Settings menu

4.1. The following chart shows different options for settings. The option will appear in the upper line of the display while the lower line will show the value to be changed.

Last Failure Delete value The last maffunction will be saved even in case of power-disconnection and can be deleted by pushing the button "Quittung" Level Start 0 - 100 (200) cm The value determines start level of pump Level Stop 0 - 100 (200) cm The value determines stop level of pump High-water level 0 - 100 (200) cm Once predetermined value is exceeded, the collective fault report relay and the high-water relay are activated Operating limit 0 - 60 Min. The value 0 deactivates this function. If the value is set between 1-60 min. the pump shuts off if the set operating time has been exceeded without interruption Start Delay 0 - 180 sec. After a power outage the pump will only start after the pre-set time is over. The display will show the remaining time. Current Limit 0.3 - 12.0 A If the pump exceeds the set power intake for a certain time, it shuts off. The display shows: Overload. The pump will only be re-activated after the button "Quittung" has been pressed Force activation Is deactivated, Is activated = If the pump has not been activated for 24 hrs, it will automatically run for 5 seconds Acoustic alarm Is deactivated, Is activated = The fault information-relay will be synchronized Instead of a flashing light it is possible to use a more economic steady burning light Thervall - Alarm Is deactivated, Is activated = In case of a malfunction the mean pusc. Sound Instead of a flashing	1. line of Display	Option for Setting	Explanation
disconnection and can be deleted by pushing the button "Quittung" Level Start 0 - 100 (200) cm The value determines start level of pump High-water level 0 - 100 (200) cm The value determines top level of pump High-water level 0 - 100 (200) cm Once predetermined value is exceeded, the collective fault report relay and the high-water relay are activated Operating limit 0 - 60 Min. The value determines stop level of pump Start Delay 0 - 180 sec. After a power outage the pump will only start after the pre-set time is over. The display will show the remaining time. Stop Delay 0 - 180 sec. After the Stop level is reached, the pump will keep running until the pre-set time is over. Current Limit 0.3 - 12.0 A If the pump exceeds the set power intake for a certain time, it shuts off. The display shows: Overloads. The pump will only be re-activated atter the button "Quittung" has been pressed Force activation Is deactivated, Is activated = In case of a malfunction the internal piezo-buzzer will sactivated Intervall - Alarm Is deactivated, Is activated = In case the phase sequence is wrong or if L2/L3 have been missed an alarm will be triggered and the pumps cannot be activated. ATEX - Mode Is deactivated, Is activated = In case the phase sequence is wrong or if L2/L3 have been missed an alarm will be triggered and the pumps cannot be activated.

4.2. Additions to individual bullets of the settings menu

Start Delay

The pre-set start delay will only be active after a power outage. For all further activations the pumps will start up right away once activated by the level.

Minimal level settings (On/Off)

If the start level is chosen to be smaller than 5 cm, the software will automatically use 5 cm as start level. If a stop level is chosen to be smaller than 3 cm, the software will automatically use 3 cm as stop level. In addition, the start of the stop delay time will then begin at 3 cm. This is necessary in order to safely operate the control unit.

Stop delay

Stop delay will make it possible to pump out below the level sensor (for example for impact pressure systems)

NEW ! Monitoring of operating time

The bullet "Operation limit" can be chosen in the menu. In the condition supplied at delivery, the value is set to zero. This means the function is deactivated. If the value is set between 1 - 60 minutes the pump will be deactivated once it ran for longer than the pre-set time without interruption. Additionally, an alarm will be triggered and an according fault report will appear on the display. The pump will only proceed once the fault has been confirmed. The operation time monitoring concerns the automatic mode and the manual mode.

Current limit (max. current)

The nominal current of the according pumps can be adjusted directly. The software of the control unit will add a certain percentage to a set value in order to adjust tolerances. The activation will occur according to a l^2/t function and therefore considers the high starting current of the pump. For pumps where the temperature control consists of a single bimetallic contact, the malfunction "thermal fault 1" can be deactivated in the menu. "Thermal fault 2" cannot be deactivated in the menu.

9

NEW!

Fault memory

The last malfunction that occurred will be saved even in situations with 0 -potential and can be checked in the menu under "Last failure" Once the malfunction has been checked in the menu, it can be deleted from the memory by using the button *"Quittung"*.

NEW! Rotating field fault

The rotating field monitor monitors the phase sequence as well as the absence of a phase. In case of a phase malfunction the pumps are locked, an alarm is triggered, and the display shows the message "Rotating field fault". The rotating field monitor can be activated and deactivated in the menu. When operating single phase motors the rotating field monitor has to be deactivated.

Atex – Mode

For application of pumps in the Ex – area the Atex- mode needs to be activated in the menu. The Atex-mode prevents an activation of the pump through the manual mode, the forced activation, or the remote control system as long as the stop level has not been reached. If the pumps are activated over the stop delay mode or manual mode while the stop level is exceeded, it is possible to pump out in order to reach a level below the stop level. After 2 minutes, the manual mode is automatically deactivated. If the Atex-mode prevents the pump from being activated, the display will show the message "ATEX: Level less than stop level".

Service – Mode

ATTENTION! In the condition supplied at delivery the service mode is activated, meaning all settings can be adjusted. Deactivating the service mode in the menu leads to only being able to check values over the digital potentiometer. While the service mode is deactivated no setting (with the exception of "language") can be adjusted.

Level Control

There is a choice whether the control unit is operated by the internal level sensor (impact pressure, air supply), an external level sensor 4-20 mA, or a floating switch.

ATTENTION! The terminal for the high-water alarm (terminal 16/17) always remains active and may be used as a redundant monitor. As soon as terminals 16/17 are connected, high-water alarm will be triggered and the pump is activated.

When utilizing external 4-20 mA level sensors and floating switches that are mounted in the Exarea, components with according approvals need to be used as well.

20 mA =>Level

This setting causes the control settings and the level display to be aligned with a connected external 4-20 mA level sensor. The processor re-calculates the incoming signal so the correct level is displayed.

ATTENTION! If the effective range of the 4-20 mA level sensor has been changed in the menu, the level settings need to be re-adjusted as well because they will have changed with the system. Therefore, the right order would be to first change the effective range of the Level sensor and to adjust the level settings afterwards. For operation in the Ex-zone according regulations have to be obeyed. This means the 4-20 mA level sensor needs to have the according approval and a matching Ex-barrier needs to be used. If the control settings lie outside the set range of the level sensor, the message "Please check control settings" will be displayed.

Language

Supplied at delivery are German and English. If desired Polish/ Czech/Italian/French can be supplied. The language can even be adjusted when the service mode is deactivated.

5.0. Fault messages, possible malfunctions, corrections

5.1. Fault messages on the display

Message on Display	Possible cause	Correction
Thermal Fault 1	The controller contact of the according pump initiates.	If the pump in use does not come with the required thermal motor protection contact the mode needs to be deactivated in the menu (compare to 4.2.Thermal Fault 1, Thermal fault 2). Check the pump. If it is plugged, clean out the foreign matter. Check the motor for sufficient cooling (dry run).
Thermal fault 2	The limiting contact of the according pump initiates.	If the pump in use does not have the required thermal motor protection contact every pump that is used needs to be bridged. (compare to 6.3 Themal motor protection contact. Check the pump. If it is plugged, clean out the foreign matter. Check the motor for sufficient cooling (dry run). After the pump has cooled off, push the button "Quittung" in order to unlock the pump.
Pump off	Phase 2 is missing or the control unit is being operated without charge.	Check feed-in, pump cables, and pump
High-water-Alarm	The level has exceeded the flood setting	Check pump for mode or high-water level
High-waterswitch	Contact for the high-water switch has closed	Check if pump/ floating switch are functioning
Reverse signals start/stop level	The settings for start and stop levels interfere.	Check level settings
Reverse signals start/flood level	The settings for high-water alarm and start level interfere	Check settings for level
Runtime error	Pumps run without interruption for longer than the time set.	Check functioning of pump
Floating switch malfunction	Validation of floating switches, wrong order	Check if floating switch is functioning and check if it is connected to power correctly
Dry run protection activated	Contact for dry run protection has been activated	Check functioning of pump / floating switch
Interface < 3 mA	Signal of external level sensor lower than 3 mA	Check level sensor, Ex-barrier, and electrical connections
Please check control settings	The effective range of the external level sensor has been changed. The level settings lie outside the effective range.	Check settings for level
Rotating field	One or two phases are missing, or rather the rotating field is not correct	Check if all 3 phases are adjacent and if the rotating field is correct.
ATEX: level less than stop level	The Atex mode has been activated and the level lies below the stop level of the chosen pump.	Before being able to activate the pumps, the level in the Ex-area needs to rise over the stop level of the pump. As long as the pumps are not in the Ex-area, the Atex mode can be deactivated in the menu.

5.2. The settings in the menu cannot be adjusted

ATTENTION! Check the menu whether the service-mode is activated

6.0. Installation, electrical connection

6.1. Installation

The control unit PS1 – LCD N is placed in a control box that measures $290 \times 180 \times 105$ mm (H x W x D with bolts and air connection). In order to attach the control box, there are 4 drilled holes.

6.2. Hose connection

The delivery standard for the hose connection is a screwed hose connection 8/6 mm. As an option the control unit can be delivered with different screwed hose connections. It is also possible to exchange the screwed hose connection later on. The hose connection needs to have an inside thread G1/8" towards the control unit. When exchanging the hose connection it is important to hold the according nut with a 14 mm wrench. You need to make sure to use an appropriate sealing agent when inserting the screw connection.

6.3. Electric connection, power supply, and pumps

The electric connection needs to be installed by an electrician according to the valid regulations.

A circuit protection to the mains of max. 3 x 16 A (delay action) needs to be installed.

Connection Power supply (3 ~) L1, L2, L3, N, PE (pic 1a in attachment) (There is a duplicate to each terminal and they are bridged internally)

The terminals are designed for a max cable cross sectional area of 4 mm². It is important to make sure a right-sided rotating field is set-up. The terminals are labeled L1, L2, L3, N and PE.

Connection of pump:

The connections L1 L2 L3 of the pump are directly attached to the motor contactor. The protective earth conductor is connected to the remaining PE terminal.

The bimetallic contact, which unlocks the pump after it has cooled down, needs to be connected to terminal 20/21; the bimetallic contact that unlocks the pump after pressing the "Quittung" button needs to be connected to terminal 21/22 on the upper circuit board. (In case Temp.1 is not being connected, *thermal fault 1* needs to be deactivated in the menu).

To operate 1 ~ motors (230V AC) a bridge between input terminal L1 to L2, as well as between N an L3 are necessary.

Power supply to the pumps (1~)

The connection of the pumps occurs on contactor T2 = L und T3 = N ATTENTION! Because measuring the current needs to happen through T2, the motor needs to be connected at this terminal.

Thermal motor protection contact

Warning contact	Temp 1 / Terminal 20/21 the pump is unlocked automatically after having cooled off.
Limiting contact	Temp 2 / Terminal 21/22 The pump is unlocked after pushing the button "Quittung"

If Temp.1 is not used, the mode needs to be deactivated in the menu (compare to 4.2). If Temp. 2 is not used, a wire jumper needs to be put in place between terminal 21 and 22.

For pumps in which the bimetallic contact is connected in a way so it will directly interrupt the current of the pump, the message "*Pump Off*" will appear once the bimetallic contact triggers. The pump will only resume operation once the fault report is confirmed (*Quittung*).

6.4 - 8 Electric connection of the fault terminals and signal inlets (pic 2 attachment)

6.4 Fault terminals

Terminal 3 / 4 = Overall failure, voltage free, closed in case of alarm (Terminals 1 /2 and 3 /4 are active for each failure, even in case of high-water alarm).

Terminal 5 / 6 = High-water alarm, voltage free output, closed in case of alarm

6.5. Port for floating switch dry run protection

Terminal 10/11 = Dry run protectionPolarity of the terminals: 10 = Plus and 11 = Minus

When connecting a floating switch to terminals 10-11 surfacing of the cutting unit/ blade wheel from the medium can be prevented. **Caution.** The Dry run protection is only active in automatic mode.

When used in the Ex-zone, the according regulations need to be obeyed. If a special program has been agreed upon, it is **optional** to enable this terminal to lock the unit

6.6. Examples for connections when operating the control unit with floating switches

The display shows which switch is closed. The use of a Normally Open is always mandatory. *"Floating switch"* needs to be selected in the menu under *"level control"* The port for high water alarm (terminals 16 / 17) always remains active.

If used in the Ex-zone according regulations need to be obeyed.

6.7. External level sensor 4 – 20 mA

"4 - 20 mA Interface" needs to be selected under "level control" in the menu. An external sensor dual conductor system 4 – 20 mA may connected to terminals 34 (-) and 35 (+)

The sensor is supplied with a stabilized DC voltage of approximately 20 Volts. At delivery the effective range of the level sensor is set so it matches the effective range of the internal pressure sensor. If connecting a level sensor with a different effective range the according setting needs to be changed in the menu (compare to 4.2). The output is active meaning the control unit supplies the sensor with power.

If used in the Ex-zone according regulations need to be obeyed.

6.8. Analog Outlets

Analog outlets are supposed to be used for the connection to control systems. Signals change proportionally to the level.

0 -10 V = Terminal 36 (+) and 37 (-) (load max. of 20 mA) 4 - 20 mA = Terminal 38 (+) and 39 (-) (resistance max. 250 Ohm)

The length for the cable used for analog outlets should not exceed 1.50m

7.0. Trial phase without pump

7.1. In order to test the control unit without pumps the following needs to be considered

- It is sufficient to connect N1 and L1
- Unless the motor current protection is set to 0 A, the message "L pump off" will appear
- Terminals 21 / 22 need to be bridged, otherwise the message "Thermal Fault 2" will appear.
- Thermal fault 1 need to be deactivated in the settings menu, otherwise the message *"Thermal Fault 1"* will appear.

8.0. <u>Technical data</u>

Operating Voltage :	3 ~ 400V (L1, L2, L3, N, PE)
Frequency:	50 / 60 Hz
Control voltage:	230V / AC
Power consumption:	max. 10 VA
Max. connected load:	P2 < 4KW (optional P2 < 5,5 KW)
Range of electr. motor protection:	0,3 - 12 A (optional 16 A)
Alarm contact 230V:	1 A
Alarm contact voltage free:	3 A
Housing:	Polycarbonat
Type of protection:	IP 54
Pressure range (internal sensor):	0 - 1 mWs (0 - 2mWs option)
Temperature range:	- 20 to + 60 °C
Measurements:	180 x 290 x 105 mm (W x H x D)
	Measurements with cable connection and air supply
Fuse:	5 x 20 1AT (alarm outlet)
Power supply	
for 4-20 mA Level sensor:	20V / DC
cable connections:	2 x M25 x 1,5
	1 x M16 x 1,5
Hose connection:	6/8 mm (If desired, different hose connections
	can be delivered).

Technical Data always remain subject to change!

9.0. <u>Norms:</u>

Applicable EU regulations:	EG – low voltage directive 2006/95/EG
Harmonizing norms in	EG – electromagnetical compatibility 2004/108/EG
use, particularly:	EN 61000 - 6 - 2: 2005
	EN 61000 - 6 - 3:2007 EN 61010 - 1:2001 + Update 1:2002
	+ Update 2:2004

Terminal connection of 3~ motors

Terminal connection of 1~ motor
